PREFACE

This report presents the results of an Air Force occupational survey of the Precision Imagery and Audiovisual Media Maintenance specialty (AFSC 404X0). This survey was requested by the AFSC 404X0 Training Staff Officer (TSO), DCS/Technical Training, HQ Air Training Command (HQ ATC/TTQL), to determine the amount and type of electronics principles training necessary for individuals entering the AFSC, due to a substantial influx of electronic equipment entering the field.

The survey instrument used in this project was developed by Captain Beverly C. Handy, Inventory Development Specialist. Ms Becky Hernandez provided computer support for this project. Chief Master Sergeant James T. Duffy analyzed the survey data and wrote the report. Administrative support was provided by Ms Anita R. Carter. This report was reviewed and approved by Lieutenant Colonel Charles D. Gorman, Chief, Airman Analysis Branch, Occupational Analysis Division, USAF Occupational Measurement Center.

Copies of this report are distributed to Air Staff sections, major commands, and other interested training and management personnel. Additional copies are available upon request to the USAF Occupational Measurement Center, Attention: Chief, Occupational Analysis Division (OMY), Randolph AFB, Texas 78150-5000.

PAUL T. RINGENBACH, Colonel, USAF Commander USAF Occupational Measurement Center

JOSEPH S. TARTELL, GM-14 Chief, Occupational Analysis Division USAF Occupational Measurement Center

SUMMARY OF RESULTS

- 1. Survey Coverage: Of the 352 enlisted members in the 404X0 career ladder, 267, or 84 percent of the total specialty population, were in the final survey sample. Eighty-nine percent of personnel sampled were assigned to SAC, MAC, and the Tactical Air Forces.
- 2. Specialty Jobs: Analysis of the Precision Imagery and Audiovisual Media Maintenance career ladder identified two clusters and five independent job types (IJT):

Base Photo Lab and Audiovisual Maintenance Cluster Photographic Support Systems Cluster Photo Reconnaissance/ARP Supervisors IJT Motion Picture Camera Maintenance Personnel IJT Resident Course Instructor Personnel IJT Apprentice Light Table Maintenance Personnel IJT Apprentice Projector Maintenance Personnel IJT

A majority of incumbents were found to be performing maintenance tasks related to photo labs, audiovisual libraries, or photographic support systems. Only the Photo Reconnaissance/ARP Supervisors are performing primarily supervisory tasks, but they represent less than 1 percent of the survey sample.

- 3. Career Ladder Progression: The 3- and 5-skill level jobs are highly technical, with little responsibility for supervision or management. While reporting performing some supervisory task performance, the majority of 7-skill members perform a job that is also technically oriented.
- 4. AFR 39-1 Specialty Descriptions: The 3-, 5-, and 7-skill level descriptions accurately reflected the jobs in the career ladder which involved maintenance on large numbers of photographic and audiovisual equipment items.
- 5. Training: The career ladder training documents (STS and POI) may require adjustments to insure structured training supports jobs performed by 404X0 personnel in the field.
- 5. Electronics Principles: When compared to the 1984 Lowry EPI, the G3ABR40430 POI adequately supports the needs of the career field.

OCCUPATIONAL SURVEY REPORT PRECISION IMAGERY AND AUDIOVISUAL MEDIA MAINTENANCE (AFSC 404X0)

INTRODUCTION

This is a report of an occupational survey of the Precision Imagery and Audiovisual Media Maintenance career ladder completed by the Occupational Analysis Division, USAF Occupational Measurement Center, in April 1986. The specialty was last surveyed in May 1981. A specific issue to be considered in this report is the evaluation of the amount and type of electronics principles training necessary due to a substantial influx of electronics equipment entering the field.

Along with the training issue, many other areas will be analyzed in this occupational survey report (OSR). Some of these include specialized job identification, major command differences, continental United States (CONUS) versus overseas differences, as well as differences by paygrade, total active federal military service (TAFMS), and duty AFSC skill level groups. Job satisfaction data, such as perceived utilization of talents and reenlistment intentions, will also be reviewed.

TO A STATE OF THE PROPERTY OF THE PARTY OF T

Background

As described in the AFR 39-1 specialty description for this AFSC, Precision Imagery and Audiovisual Media Maintenance specialists are responsible for in-shop maintenance of all Air Force ground electronic precision imagery and audiovisual equipment. This includes items such as processors, printers, projectors, still or motion picture cameras, and duplicating and processing graphics equipment.

History

The 404XO career ladder was created 30 September 1964 from the 402XO, Photographic Repairman Specialty. Originally titled Precision Photographic Systems Specialty, the career ladder was changed 30 April 1978 to Precision Imagery and Audiovisual Media Specialty, still with the AFSC designation of 404XO.

Technical Training

AFSC 404X0 Precision Imagery and Audiovisual Media Maintenance personnel receive basic resident training from the 3400 TCHTW, Lowry AFB, Colorado. Since this is a Category "A" AFSC, course attendance is mandatory for award of the 3-skill level. The course is 78 days in duration, with the first 5 weeks consisting of electronics principles training.

APPROVED FOR PUBLIC RELEASE; DISTRIBUTION UNLIMITED

SURVEY METHODOLOGY

Inventory Development

The data collection instrument for this survey was USAF Job Inventory AFPT 90-404-546, dated September 1984. A tentative task list was prepared by the Inventory Developer after reviewing pertinent career ladder publications and directives, tasks from previous survey instruments, and data from the last OSR. To ensure full coverage of the variety of tasks performed by members of the career ladder, critical bases were identified and visited by the Inventory Developer. This step is important, since visiting bases which maintain the same or similar systems and overlooking bases which maintain unique or different systems may bias the task list and invalidate the results. Those bases and the reason visited are as follows:

Lowry AFB CO - - - Technical School

STATE OF THE PROPERTY OF THE P

Hurlburt Field FL - Maintains unique Mobile Facility

Beale AFB CA - - - - Maintains processing equipment associated with SR-71 Reconnaissance Aircraft

Vandenberg AFB CA - Maintains high speed precision tracking equipment used to film missile launches

Norton AFB CA - - - Responsible for all Air Force films, i.e., AF Now, Recruiting and Training; thus maintains a wide variety of audiovisual equipment

Offutt AFB NE - - - Maintains full range of photographic interpretation and other strategic intelligence-related equipment

Bergstrom AFB TX - Maintains the WS-430 Relocatable Facility

A total of 30 career ladder members participated in the interviews at the above locations. The Air Force Functional Manager, Training Staff Officer, MAJCOM Functional Manager, Classification and Standards, and Assignments personnel for the field were also contacted.

An instrument consisting of 1,194 tasks listed under 14 major duty headings is the final result of this exhaustive effort. The survey instrument also included a background section that requested information such as job title, duty area, major command of assignment, and job satisfaction data.

Data Ccilection

From movember 1984 to April 1985, consolidated base personnel offices (CLFO) at operational units worldwide administered the inventory to personnel

holding the 404XO Air Force Specialty. Participants were selected from a computer-generated mailing list obtained from personnel data tapes maintained by the Air Force Human Resources Laboratory (AFHRL).

Each individual who was administered the inventory first completed an identification and biographical information section and then checked each task performed in his current job. The participants then rated the tasks checked, on a 9-point scale, showing the relative time spent on that task as compared to all other tasks. The time spent ratings are measured on a scale which ranges from 1 (Very small amount of time) through 5 (About average amount of time) to 9 (Very large amount of time).

Time spent is defined as a relative measure of how much time individuals perceive themselves to spend on each task, as compared to all other tasks checked in the survey. To calculate time spent, all of an incumbent's ratings are assumed to account for 100 percent of his or her time spent on the job. The rating for each task is divided by the sum of all ratings, then multiplied by 100 to provide a relative percentage of time for each task. This procedure provides a basis for comparing tasks in terms of both percent members performing (where a task is checked by an incumbent) and relative time spent (based on the calculations from the 1-9 scale).

Survey Sample

Personnel were selected to participate in this survey to ensure an accurate representation across major commands and paygrade groups. All eligible DAFSC 404XO personnel were mailed survey booklets. To be eligible for the survey, personnel must have held a DAFSC of 40430, 40450, or 40470, and have worked in their present job for at least 6 weeks. Those ineligible, and not mailed booklets, include personnel in hospital status, retiring, or being discharged.

Table 1 shows the percentage distribution, by major command, of assigned personnel in the career ladder as of November 1984. Also listed in this table is the percentage distribution, by MAJCOM, of respondents in the final survey. The 267 respondents included in the final sample represent 84 percent of those eligible. Table 2 reflects the paygrade group distribution. As reflected in these tables, the survey sample provides excellent representation of the career ladder population.

Task Factor Administration

In addition to the job inventory, selected senior personnel in AFSC 404X0 completed a second booklet which provided separately processed information concerning either task difficulty (TD) or training emphasis (TE) ratings. TD refers to the length of time required for the average job incumbent to learn to do the task. TE refers to the importance of structured training for first-enlistment personnel. Structured training is training provided through any organized training method, such as resident technical school, field training detachments, mobile training teams, or formal OJT.

Task Difficulty (TD). Each individual completing a TD booklet rated each task with which they were familiar. Tasks were rated on a 9-point scale, ranging from 1 (extremely low relative difficulty) to 9 (extremely high relative difficulty). The interrater reliability (as assessed through components of variance of standardized group means) of the TD data provided by 31 senior NCOs was .92, indicating good agreement among raters. TD ratings were adjusted to give a rating of 5.00 for a task of average difficulty, with a standard deviation of 1.00. Data are then used to rank-order the inventory tasks in terms of relative difficulty.

Job Difficulty Index (JDI). Task difficulty is also used to compute a JDI for job groups identified in the analysis of the survey, to provide a relative measure of the difficulty of jobs in comparison to each other. The JDI is computed using the number of tasks performed and the average difficulty per unit time spent. (Thus a group will have a higher JDI as a result of spending more time on difficult tasks and performing more tasks.) After measurements are standardized, the index ranges from 1.0 for a very simple job to 25.0 for a very complex job, with an average of 13.0.

Training Emphasis (TE). Individuals completing TE booklets were asked to rate all tasks on a 10-point scale from no training required to extremely heavy training required. Training emphasis ratings by 404XO subject-matter

specialists showed high disagreement among raters. As a result, interrater reliability was too low to allow utilization of TE emphasis data. Consequently, training emphasis is not addressed in this report.

SPECIALTY JOBS (Career Ladder Structure)

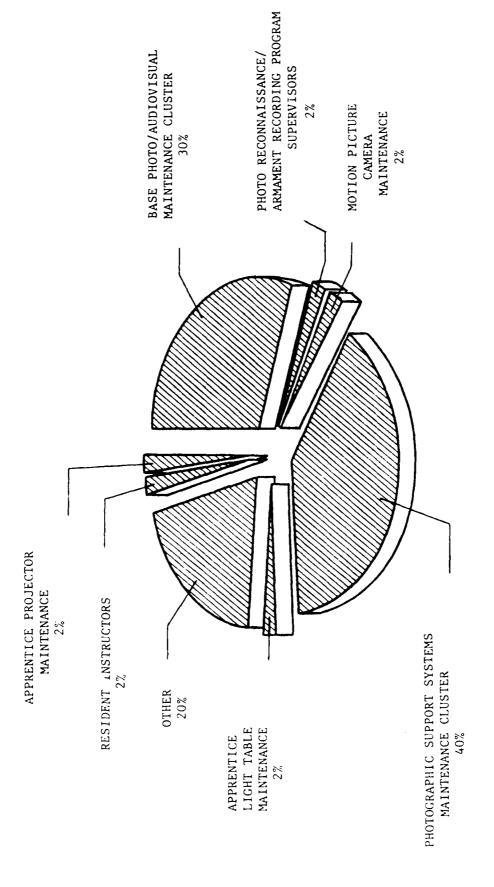

An important function of the USAF occupational analysis program is to examine the career ladder structure within a specialty. Based on responses to survey questions, the computer clustering program clusters individuals together based on similarity of tasks performed and the amount of time spent on those tasks. Analysis of the distinct jobs performed within the career ladder and their relationship to each other results in a display of the structure of work within the specialty. This information can be used to understand current utilization of personnel to identify job satisfaction trends that may impact management decisions, or to examine such career ladder documents as AFR 39-1 Specialty Descriptions, Specialty Training Standards (STS), or course Plan of Instruction (POI).

Specialty Overview

The Precision Imagery and Audiovisual Media Maintenance career ladder divides into two major functional areas, one related to maintenance of equipment found in base photo labs or audiovisual libraries (representing 30 percent of the total sample) and one related to the repairing of equipment common to photographic support systems (representing 40 percent of the total sample). Those members performing tasks related to base photo labs and audiovisual libraries perform tasks on a wide range of photographic, photographic support systems, and audiovisual multimedia sound equipment, and usually are integrated with other AFSCs in one workcenter. In this environment, the average number of people being supervised is very few (average 2); hence, these personn.. normally will perform supervisory tasks only in the accomplishment of their technical jobs. On the other hand, those job groups within the photographic support systems functions also perform tasks on a wide variety of equipment, but mainly where that equipment supports a reconnaissance or tactical fighter operation, both relocatable and nonrelocatable. Personnel in supervisory functions in this group are usually NCCICs or superintendents of shops and perform those tasks associated with upper level supervisors. Analysis identified two clusters (groups of related jobs) and five independent job types (groups of personnel performing essentially the same job, but too dissimilar from other job types to be included in a cluster) within the Precision Imagery and Audiovisual Multimedia career ladder (See Figure 1). As listed below, the group (GRP) number refers to computer-printed information. and the number of personnel in the group is represented by the letter "N".

1. BASE PHOTO LAB AND AUDIOVISUAL MAINTENANCE CLUSTER (GRP023, N 💯

- II. PHOTOGRAPHIC SUPPORT SYSTEMS CLUSTER (GRP030, N=109)

Control of the contro

- A. Relocatable Facility Maintenance Personnel (GRP117, N=23)
- B. Nonrelocatable Facility Maintenance Personnel (GRP110, N=24)
- C. Processor Maintenance Personnel (GRP067, N=5)
- D. Printer Maintenance Personnel (GRP100, N=5)
- E. Armament Recording Program (ARP) Personnel (GRP077, N=8)
- F. Junior Relocatable Facility Maintenance Personnel (GRP102, (N=7)
- III. PHOTO RECONNAISSANCE/ARP SUPERVISORS (GRP145, N=7)
- IV. MOTION PICTURE CAMERA MAINTENANCE PERSONNEL (GRP058, N=5)
- V. RESIDENT COURSE INSTRUCTOR PERSONNEL (GRP096, N=5)
- VI. APPRENTICE LIGHT TABLE MAINTENANCE PERSONNEL (GRP068, N=5)
- VII. APPRENTICE PROJECTOR MAINTENANCE PERSONNEL (GRP075, N=5)

Eighty percent of the survey respondents clustered into the above job groups. Of the remaining 20 percent, most formed groups too small to be identified as a distinct job type in the analysis, and the functions they performed were too dissimilar to be grouped with other job types. Examples of these jobs are: (1) NCOIC, Special Projects; (2) Assistant NCOIC Intelligence; (3) Resource Manager; and (4) Quality Control Technician. Most of these personnel performed a set of tasks related in some way to administration.

Group Descriptions

The following narratives describe the clusters and independent job types identified in the analysis. Tables 3 and 4 provide selected background and job satisfaction data for these groups. (Selected background and job satisfaction data, together with representative tasks for all identified groups, are listed in Appendix A.)

I. BASE PHOTO LAB AND AUDIOVISUAL MAINTENANCE CLUSTER (GRP023). This cluster contains 79 members, representing 30 percent of the total sample. The cluster was formed based on the performance of a wide range of tasks (an average of 282 are performed by group members) concerning photo lab and audiovisual library equipment maintenance. These personnel are an integral part of either a base photo lab, audiovisual library, or a combination of both. Group members utilize hand and special tools on test-and-shop equipment to close.

inspect, isolate malfunctions, remove and replace components and component parts, and operationally check those items of equipment common to base photo labs and audiovisual libraries. The average paygrade for group members is E-4, with 6 years (72 months) being the average time in career field, and over 7 years (87 months) average for Total Active Federal Military Service (TAFMS). Group members spend 49 percent of their relative job time on tasks in technical duties involving the installation and maintenance of photographic support systems equipment (slide mounters, timers, print dryers, etc.), maintenance of audiovisual and multimedia sound equipment (projectors, cassette tape recorders-players, etc.), and camera maintenance (still, motion picture, and general camera equipment). Additionally, ll percent of their time is devoted to the administration and supply-oriented aspects of the job. A sampling of the tasks performed includes:

isolate malfunctions in slide mounters perform operational checks on timers adjust slide projectors adjust sound motion picture projectors inspect electronic flash units perform operational checks on still or copy cameras locate part or stock numbers maintain maintenance record files

The three jobs identified within this cluster are differentiated from one another by the specific equipment maintained and the average number of tasks performed.

- A. Base Photographic Lab Maintenance Personnel (GRP147). Seventeen people perform an average of 383 tasks, with the majority of their time being spent on photographic support systems and still camera equipment maintenance. It should be pointed out that a lesser amount of time is also spent repairing and maintaining audiovisual and multimedia sound equipment. Members of this group are the senior personnel (E-5) of the cluster, averaging over 9 years in the service (115 months).
- B. Base Audiovisual and Multimedia Sound Equipment Repairmen (GRP148). These five people spend more of their time performing tasks associated with repairing and maintaining audiovisual equipment than they do on tasks pertaining to installing and maintaining photographic support systems. An average of 408 tasks are performed by group members; average paygrade is E-4, with an average of 68 months TAFMS. Of the 5 members in the group, 3 are 5-skill level and 2 are 7-skill level.
- C. Camera Maintenance Personnel (GRP074). This group of eight people perform by far the largest number of tasks (509) of any group in this cluster. They also differ from the other two groups in that the majority of their time is spent maintaining still and motion picture cameras and associated camera equipment. A small amount of their time is spent repairing

audiovisual and multimedia sound equipment. This group's job is also relatively difficult. This finding is supported by the fact that they have the highest Job Difficulty Index (JDI) (20.3) of all the groups identified in the total sample.

II. PHOTOGRAPHIC SUPPORT SYSTEMS CLUSTER (GCP030). The 109 members (40 percent of the total sample) in this cluster have maintenance responsibilities in support of tactical and strategical reconnaissance units located around the world. They spend 70 percent of their time performing tasks on photographic support systems and photographic processing equipment installed in relocatable and nonrelocatable facilities. Also included in this group are personnel who maintain equipment utilized in Armament Recording Program (ARP) labs (Aircraft Gun Camera Film Processing Units). Comprising the largest group identified in the career ladder, these personnel perform an average of 136 tasks. Examples of these tasks are:

remove or replace processor rollers or roller bearing system components perform operational checks on processors perform corrosion control on relocatable facilities inspect relocatable facilities perform corrosion control on hydromixers remove or replace chemical mixing pumps inspect continuous contact printers adjust continuous contact printers isolate malfurctions in processor electrical components measure and cut copper, stainless steel, or PVC tubing

With an average grade of E-4 and an average of 4 years in the career ladder, the cluster is dominated by 5-skill level personnel (62 percent) and contains representatives from the major commands having reconnaissance functions (TAC, SAC, USAFE, and PACAF). The cluster, while representing job performance of this career ladder, includes identifiable job differences which are described in greater detail below.

A. Relocatable Facility Maintenance Personnel (GRP117). The 23 airmen forming this group are distinguished from the overall cluster by their higher percentage of time spent on tasks involving the installation and maintenance of photographic support systems and maintenance of relocatable facilities. Individuals indicated that 60 percent of their relative job time is devoted to tasks related to maintenance of the equipment (processors, printers, etc.) located in relocatable facilities and the upkeep of the relocatable facility itself (corrosion control, inspections, etc.). They average just over 4 years (50.5 months) TAFMS and have an average grade of E-4. Personnel in this group are assigned to the three major commands possessing relocatable facilities (TAC - 47.8 percent, USAFE - 43.5 percent, and PACAF - 8.7 percent). Group members perform a larger number of tasks (an average of 206 versus 136 for the cluster), with 78 percent being 5-skill level.

PROBLEM TRANSPORT PROBLEM TRANSPORT

Considered contraction tractional description of

- B. Nonrelocatable Facility Maintenance Personnel (GRP110). These personnel also perform a greater number of tasks (an average of 249 versus 136 for the cluster). Unlike the relocatable facilities maintenance group above, these personnel spend 63 percent of their time installing and maintaining photographic support systems and photographic processing equipment in permanent facilities. Seventy-nine percent of the members are assigned to reconnaissance units that do not utilize relocatable facilities in the performance of their missions. Of the 24 members in this group, 21 percent are 3-skill level, 58 percent are 5-skill level, and the remaining 21 percent are 7-skill level. Group members spend a small amount of time (13 percent) maintaining printer systems.
- (. Processor Maintenance Personnel (GRP067). Members of this group have an average grade of E-3, with 60 percent at the 3-skill level. The majority of their job time (40 percent) is spent performing tasks on photographic processing equipment. These tasks include inspecting, performing corrosion control, adjusting, connecting and disconnecting components and lines, and cleaning processors and processor equipment. They average 106 tasks and 80 percent are assigned to overseas locations.
- D. Printer Maintenance Personnel (GRP100). This group spenJs more time (35 percent) performing tasks associated with maintaining printers than do any of the groups identified in the cluster. Of the 5 members of this group, 100 percent indicate they perform tasks on manual contact, continuous contact, and manual projection printers, while 80 percent perform maintenance on electronic projection printers. Their average grade is E-4 with two 3-skill level, one 5-skill level, and two 7-skill level members.
- E. Armament Recording Program (ARP) Personnel (GRP077). This group contains 8 members assigned to TAC. Seven of the 8 personnel perform tasks pertaining to the maintenance of photographic support systems and photographic processing equipment necessary to support fighter aircraft curcamera film processing. Averaging over 7 years in the career ladder, 75 percent of the members hold a 5-skill level. The average grade is E-4. Additionally, 16 percent of their relative job time is spent in administration and supply functions such as locating part or stock numbers and making entries on and reviewing AFTO Forms 95 (Historical Records).
- F. Junior Relocatable Facility Maintenance Personnel (GRP102). Members in this group average just over 1 year (16 months) TAFMS and have an average grade of E-3. Five of the 7 members of this group are assigned to USAFE, with the other 2 members assigned to TAC. They spend 58 percent of their job time maintaining relocatable facilities and photographic support systems. Due to their limited experience (averaging only 14 months in the career field), they perform substantially fewer tasks (an average of 90) than any of the groups identified in the cluster. Tasks performed by 100 percent of the group include: (1) performing corrosion control; (2) inspecting relocatable facilities; and (3) inspecting and performing corrosion control on relocatable facility leveling jacks.
- III. PHOTO RECONNAISSANCE/ARP SUPERVISORS (GRP145). The 7 members of this independent job type spend 65 percent of their time or supervisory and

administrative tasks. They are the most senior group identified in the survey sample (averaging 17 years in service, with an average paygrade of E-6). These personnel function as supervisors in either a reconnaissance wing, squadron, or in an armament recording program (ARP) lab. Tasks indicative of their job include:

plan work assignments
determine work priorities
advise DCM on status of equipment, personnel,
or training needs
review daily document registers
evaluate corrosion control programs
direct maintenance or utilization of equipment
maintain training records, charts, or graphs
determine OJT training requirements

While supervising an average of 5 personnel, these group members spend an additional 16 percent of their job time maintaining photographic support systems. Performing an average of 212 tasks, these senior NCOs tend to be assigned to large shops (where a greater number of 404XO military personnel are assigned) rather than in a base photo lab or audiovisual library environment.

IV. MOTION PICTURE CAMERA MAINTENANCE PERSONNEL (GRP058). This independent job type of 5 members are all assigned to MAC's audiovisual service (1 at HQ AAVS, Norton AFB CA, and 4 at Vandenberg AFB CA). With an average paygrade of E-3, airmen in this group indicated 100 percent performance on tasks associated with motion picture camera maintenance. They perform an average of 133 tasks, including:

perform operational checks on motion picture cameras clean motion picture camera housings isolate malfunctions in external magazines clean and lubricate film takeup assemblies inspect external magazines perform corrosion centrol on motion picture cameras

Averaging just under 2 years (23 months) TAFMS, 60 percent of these personnel are 5-skill level and 40 percent 3-skill level.

V. RESIDENT COURSE INSTRUCTOR PERSONNEL (GRP096). This independent job type is comprised of 5 NCOs (average payorade of E-5) who spend 75 percent of their time conducting resident course training. An additional 21 percent of their time is spent performing administrative tasks in support of formal training. Examples of tasks performed by instructor personnel include:

conduct resident course classroom training administer tests evaluate progress of resident course students score tests maintain training records, charts, or graphs counsel trainees

Members of this group perform a limited number of tasks (average of only 12). Eighty percent are 7-skill level and 20 percent are 5-skill level. They average over 7 years (87 months) TAFMS.

VI. APPRENTICE LIGHT TABLE MAINTENANCE PERSONNEL (GRP068). All 5 personnel in this independent job type hold a 40430 or 40450 DAFSC and average under 1 year (11 months) in the service. They spend 50 percent of their time on light table maintenance and all are assigned to SAC. Due to limited experience (averaging only 9 months in the career ladder), they perform substantially fewer tasks (an average of 35) than most of the job groups in the survey sample. A sampling of the tasks performed include:

inspect light tables
isolate malfunctions in light table electronic
 components
calibrate light tables
clean and lubricate light tables
remove or replace light table electromechanical
 components

VII. APPRENTICE PROJECTOR MAINTENANCE PERSONNEL (GRP075). This group differs from the apprentice light table maintenance group in that they spend 50 percent of their time performing tasks on maintenance of projectors (slide, overhead, and sound motion picture). They perform a few more tasks (an average of 64) and average about the same amount of time in the career field (12 months), as the group above. With an average grade of E-3, 60 percent are 3-skill level and 40 percent are 5-skill level. Examples of the tasks performed include:

perform operational checks on slide projectors isolate malfunctions in sound motion picture projectors clean and lubricate overhead projectors remove or replace slide projector components adjust sound motion picture projectors inspect slide projectors

Contract Contractor Contractors Contractors reviews

Comparison of Specialty Jobs

In addition to individual descriptions of each job, a comparison of some differences and similarities in the groups helps promote a better understanding of the career ladder structure. Two areas of comparison of particular interest are job difficulty and job satisfaction indicators.

Job Difficulty. As previously mentioned, there are two major jobs in this career ladder; one relating to the maintenance of base photo lab/audiovisual library equipment, and the other relating to photographic support systems maintenance. The Job Difficulty Index (JDI), based on the number of tasks performed and the relative difficulty per unit time spent (see Task Factor Administration section), can be used to compare the difficulty of the different job groups. Those jobs related to the maintenance of base photo lab/audiovisual library equipment tend to have a higher JDI due to the greater average number of tasks performed in these jobs than in most of the photographic support systems maintenance- related job groups (see Table 3 for a complete comparison). Camera maintenance personnel have the highest JDI at 20.3--close to standard limit of 25.0. This high JDI stems from the high number of tasks these members perform; they average 509 tasks, over 100 more than the next highest group. The base photographic maintenance and base audiovisual maintenance groups have an average JDI of 19.6. They average performing 383 and 408 tasks, respectively, which tends to support the reason for high JDIs in this group.

The jobs with the lowest JDI are the apprentice light table and apprentice projector maintenance groups, with JDIs of 6.4 and 8.3, respectively. These low JDIs may be due to the low number of tasks performed (35 and 60, respectively), as well as the nature of the job. The tasks they perform tend to have lower TD ratings overall.

Job Satisfaction. As part of the background section of the survey, job incumbents were asked to respond to several questions, indicating how interesting they found their job; their perception on how well their job utilized their talents and training; how satisfied they were with the sense of accomplishment gained from their work; and their intention to reenlist. Answers from these questions may help managers identify problem areas of concern.

Members of the groups discussed indicated the jobs performed are interesting, with all groups showing 75 percent or more responding positively. Utilization of talents for each group was also high, with 80 percent responding positively. Responses pertaining to the sense of accomplishment were also positive for all groups (75 percent). Perceived use of training responses by all groups were high, with only one group (Motion Picture Camera Maintenance) showing less than 80 percent positive response. In view of the highly positive responses across the range of jobs, it is not surprising that each of the groups reflects positive reenlistment intent by an average of 69 percent. (See Table 4 for group comparisons.)

In summary, this analysis supports the current classification structure. Job satisfaction question responses indicate that individuals and training received are well matched to the gob characteristics of the career ladder oci.

consequently, a rather large percentage of the airmen in the sample expressed positive reenlistment intentions.

ANALYSIS OF DAFSC GROUPS

An analysis of DAFSC groups, in conjunction with the analysis of the career ladder structure, is an important part of each occupational analysis project. The DAFSC analysis identifies differences in tasks performed at the various skill levels. This information can be used to evaluate how well career ladder documents, such as AFR 39-1 Specialty Descriptions and the Specialty Training Standards (STS) reflect what career ladder personnel actually are doing in the field.

production to boots on analysis and accorded to the section

A comparison of task performance between DAFSCs 40430 and 40450 indicate that, while there are minor differences, by and large the jobs they perform are essentially the same. They will be discussed as a combined group in this report.

states persists from 200 and 100000000 personal personal personal

The distribution of skill level groups across career ladder jobs is displayed in Table 5, while Table 6 offers another perspective by displaying the relative percent time spent on each duty across skill level groups. A typical pattern of progression is present, with personnel spending more of their relative time on duties involving supervisory, managerial, and administrative tasks (see Table 6, Duties A, B, C, D, and E) as they move upward to the 7-skill level.

Skill Level Descriptions

DAFSC 40430/40450. The 208 airmen in the 3- and 5-skill level group (representing 78 percent of the survey sample) perform an average of 180 tasks, with 157 tasks accounting for over 50 percent of their job time. Performing a highly technical job, 78 percent of their relative duty time is devoted to tasks covering maintenance of photographic support systems equipment, such as performing corrosion control; performing operational checks on processors; inspecting hydromixers, manual contact printers, and sinks; as well as performing the various tasks on relocatable facilities. Tasks pertaining to administrative and supply actions accounted for an additional 13 percent of their duty time. Table 7 displays representative tasks performed by these airmen.

DAFSC 40470. Seven-skill level personnel, representing 22 percent of the survey sample, perform an average of 166 tasks, with 102 tasks accounting for over 50 percent of their relative job time. Eighty-four percent of the group report supervisory responsibilities, with 55 percent of their relative job time being spent on tasks in the usual supervisory, managerial, training and administrative, or supply duty areas. Table 8 displays some representative tasks performed by these 7-skill level airmen, while Table 9 shows tasks which best differentiate between DAFSC 40430, 40450, and 40470.

Summary

Career ladder progression is normal, with personnel at the 3- and 5-skill levels spending the vast majority of their job time performing technical tasks. At the 7-level, the shift to supervisory functions is quite clear as the transition from the 5-skill level to the 7-skill level is marked by an increase in supervisory, managerial, and training responsibilities.

AFR 39-1 SPECIALTY DESCRIPTIONS

Survey data for 3-, 5-, and 7-skill level members were compared to the AFR 39-1 Specialty Descriptions for the Precision Imagery and Audiovisual Media Maintenance Specialist (AFSC 40410/40430/40450) and the Precision Imagery and Audiovisual Media Maintenance Technician (AFSC 40470), dated 1 January 1982. Based on the findings of this OSR, these descriptions appear to be complete and accurately reflect the range of duties and responsibilities of the career ladder at the time of the occupational survey.

ANALYSIS OF TAFMS GROUPS

To determine how jobs change with time and experience, utilization patterns for survey respondents in different Total Active Federal Military Service (TAFMS) groups were reviewed. As is typical in most career ladders, as time in service increases, there is a corresponding increase in the performance of duties involving supervisory and managerial tasks (see Table 10). As time in supervisory and managerial duties increases, performance time on tasks in maintenance-related duties decreases. Note that for junior personnel (1-48 months), the greatest percentage of time is spent installing and maintaining photographic support systems. This greater percentage is a reflection of the number of personnel (208) in the survey sample (297 in total sample), as well as the amount of time first-enlistment personnel spend performing maintenance.

First-Enlistment Personnel

First-enlistment personnel were also examined both on the basis of common tasks performed and various background information. Table 11 lists those tasks performed by the greatest percentages of 404X0 first-enlistment personnel. The most common tasks involve some aspect of general or preventive maintenance, such as corrosion control, performing lubrication checklist, inspecting, and performing operational checks on a variety of components or component parts.

Although the tasks listed in Table II are characteristic of most firstenlistment personnel, other functions performed by these incumbents vary

somewhat, depending on the job they perform. Figure 2 presents the distribution of 404X0 first-enlistment personnel across job groups identified in the Career Ladder Structure section. As expected, over 70 percent of first-enlistment personnel are identified in either the Photographic Support Systems or Base Photo Lab/Audiovisual Maintenance clusters.

Job Satisfaction

Job satisfaction indices for personnel in the first-enlistment (1-48 menths TAFMS), second enlistment (49-96 months TAFMS) and career (97+ months TAFMS) groups were also examined. Job interest, perceived utilization of talents and training, and reenlistment intentions are presented in Table 12, along with the comparative sample for personnel from all related career ladders analyzed in 1985. When compared to the comparative sample, 404XO first-enlistment personnel have higher job satisfaction indicators and feel their talents are being used fairly well. The 404XO personnel in their second-enlistment have a somewhat higher percentage who feel their training and talents are better utilized than in the comparative sample.

ことのこと 一方のことではない かんかんかんかん

Eighty-one percent of the 404X0 second-enlistment group expressed plans to reenlist, which is slightly higher than the 49-96 months TAFMS comparative sample (73 percent). Finally, career 404X0 personnel (97+ months TAFMS) indicate a higher feeling of job satisfaction than the comparative sample in all indicators except reenlistment intent. Sixty-eight percent of 404X0 career personnel indicate they will reenlist, which is less than those career personnel in the comparative sample. It must be pointed out that 20 percent of 404X0 career ladder personnel indicated intent to retire.

TRAINING ANALYSIS

Occupational survey data are one of the many sources of information which can be used to assist training managers in the development of training programs. Proper use of these data will produce training programs which are more relevant to the needs of personnel working in their first assignments in a career ladder. Factors which may be used in evaluating training include the overall description of the jobs being performed by first-enlistment personnel and their overall distribution across career ladder jobs, percentages of first-job (1-24 months TAFMS) or first-enlistment (1-48 months TAFMS) members performing specific tasks, and task difficulty ratings (previously explained in the SURVEY METHODOLOGY section).

To assist specifically in the evaluation of the Specialty Training Standard (STS) and the Plan of Instruction (POI), subject-matter specialists (SMSs) from the Lowry Technical Training Center, Lowry Air Force Base, Colorado, matched job inventory tasks to the appropriate paragraphs and subparagraphs of the STS and POI for Course G3ABR40430 000. It is this task matching upon which comparison to those documents is based. A complete computer listing displaying the percent members performing tasks, task

^{*} Columns may not add to 100 percent due to nonresponse or rounding ** Comparative sample of Mission Equipment Maintenance career ladders surveyed in 1985 includes: AFSCs 30XXX, 31XXX, 32XXX, 34XXX, 36XXX, 40XXX, 42XXX, 43XXX, 44XXX, and 46XXX

difficulty ratings for each task, along with STS and POI matchings, has been forwarded to the technical school for their use in further detailed reviews of training documents. Summaries of the above-mentioned data and information are given below.

Specialty Training Standard (STS)

A comprehensive review of STS 404X0, dated November 1985, compared STS items to survey data. STS paragraphs and subparagraphs containing general knowledge information or subject-matter knowledge requirements were not evaluated. Overall, the STS more than provides comprehensive coverage of the work performed by personnel in the field. However, there are subparagraphs of the STS that require review by training personnel and subject-matter specialists to determine the appropriateness of their inclusion in the STS. For example, Table 13 displays data pertaining to paragraph 17b, Small Format Cameras, that has 7 technical subparagraphs which reflect low percent members performing (less than 20 percent).

A second area of analysis involves examining tasks not matched to any items in the STS. Unreferenced tasks, with at least 20 percent of a group performing them, such as first-enlistment personnel, are performed to an extent great enough (20 percent or more) that they should be included in the text of the document. There were 565 tasks not matched to any paragraphs or subparagraphs in the STS. Several of these had high percentages of first-enlistment, 5-skill level, and 7-skill level personnel performing them. For example, 56 unmatched tasks were performed by 20 percent or more 404X0 personnel, and 33 of these were performed by over 30 percent. Table 14 gives examples of unreferenced tasks performed by a substantial percentage of personnel. In reviewing the computer-generated listing, which has been forwarded to the technical school, training specialists should pay special attention to these unreferenced tasks.

Plan of Instruction (POI) G3ABR40430

Based on the previously mentioned assistance from technical school subject-matter specialists in matching tasks to the G3ABR40430 POI, dated March 1986, a computer product was generated displaying the results of the matching process. Information furnished for consideration includes percent members performing data for first-job and first-enlistment personnel and secondary factor TD ratings. As in the STS, general knowledge information or subject-matter knowledge requirements were not evaluated.

A thorough analysis of the 80 technical 40430 POI objectives revealed 27 objectives (See Appendix B for a complete listing), with less than 30 percent of first-enlistment personnel performing matched tasks. Over one-half (14) of these objectives deal with repairing the Nikon F3 small format camera. These, along with the remaining objectives, showing less than 30 percent performing, may indicate a need for training personnel to review these areas for possible deletion from retention in the POI.

MEAN TU = 5.00, SD = 1.00

Analysis of the 4C4XO STS also revealed 47 STS subparagraphs and supporting tasks where 30 percent or more first-enlistment personnel are performing associated tasks, but which are not included in the POI. Subject-matter specialists should review this series of tasks (complete listing in Appendix C) to determine the necessity for training and the most effective method to accomplish such training, either structured or nonstructured OJT or in a formal course of instruction.

A review of tasks not referenced to the POI identified 113 tasks performed by more than 30 percent of first-enlistment 404X0 personnel. Additionally, 16 of these tasks have average or high TD ratings, indicating a need for review for possible inclusion in the POI. Table 15 lists these unreferenced tasks.

Training Summary

Generally the 404X0 STS, which is a new training document, dated November 1985, was found to be a comprehensive product which should fulfill the needs of OJT supervisors in the field. Some possible problems were noted and they have been highlighted in this section.

The current POI was completed in March 1986. At the time of this rewrite of the POI, technical training school personnel did not have access to this OSR data. The product produced was based on information available to training personnel at that time. The publication of current OSR data should provide training personnel with the means to fine-tune the POI.

404XC MAJCOM GROUP COMPARISONS

Tasks performed in various Precision Imagery and Audiovisual Media Maintenance duty areas and background data for personnel of the major command (MAJCOM) with the largest 404XO population were compared to determine whether job content varied as a function of MAJCOM assignment.

Generally, jobs performed across the commands were similar, with the largest percentage of duty time in each command spent in the performance of installing and maintaining photographic processing equipment, photographic support systems, and administrative functions (see Table 16). Some variations were noted, with members of the Tactical Air Forces (TAF) - USAFE, PACAF, and TAC, reporting more job time spent or maintaining relocatable facilities than the other MAJCOMs, as previously mentioned in the SPECIALTY JOBS section of this report. Additionally, MAC airmen also indicated the greatest involvement with maintaining motion picture cameras.

ANALYSIS OF CONUS VERSUS OVERSEAS GROUPS

A comparison was made between tasks performed and background data for DAFSC 40450 personnel assigned within the CONUS versus those assigned to overseas locations. Overall, jobs performed by the two groups are very similar with respect to task performance and time spent on those tasks. DAFSC 40450 personnel in CONUS perform an average of 160 tasks, while their overseas counterparts perform an average of 153 tasks. Overseas respondents, however, seem to spend slightly more time on maintaining relocatable facilities, presumably due to the difference in mission requirements for overseas reconnaissance units.

COMPARISON TO PREVIOUS SURVEY

The results of this survey were compared to those of the previous occupational survey report (AFPT 90-404-423), dated May 1981. This analysis can help identify changes in the career ladder due to new missions, changing management policies, new equipment, and other areas and functions which might change over time. While the actual jobs performed have changed little over time, the names given those jobs in the two separate surveys have. For example, in the 1986 survey, Base Photo Lab and Audiovisual Maintenance personnel basically are doing the same job as those individuals identified in the 1981 survey as Photographic Support Systems and Audiovisual Equipment Maintenance Personnel. The few differences noted appeared in the following areas:

In the 1986 survey, three new job groups were identified. These new job groups are: (1) Armament Recording Program (ARP) Personnel, (2) Apprentice Light Table Maintenance Personnel, and (3) Apprentice Projector Maintenance Personnel. Another difference is that the Photo Reconnaissance/ARP Supervisors group does not include supervisors from base photo/audiovisual labs or higher management functions. Additionally, Quality Control NCOICs and Maintenance Schedulers job groups from the 1981 survey were not identified in this survey. They are, however, intermixed within the job groups identified by the 1986 survey. These differences are minor, and the overall career ladder structure is relatively stable.

Job satisfaction data were reviewed for both 1981 and 1986 first-, second-, and career-enlistment groups (see Table 17). Personnel in the 1 to 48 months enlistment group expressed a higher job satisfaction than the 1981 respondents, while personnel in the 49 to 96 months indicated slightly lower job satisfaction than previous respondents. Responses to talents and training utilized increased in almost all TAFMS groups, with the only exception being in the 97+ months group where perception of training utilized remained the same.

ELECTRONICS PRINCIPLES

An Electronics Principles Inventory (EPI) is a knowledge-based inventory which identifies the range of electronics principles personnel must understand to perform any electronics-oriented job. Such an EPI was completed in April 1984 (AFPT 90-EPI-490) and included Precision Imagery and Audiovisual Media Maintenance personnel, along with 32 other AFSCs whose training is conducted at Lowry Technical Training Center.

Findings from the April 1984 EPI indicate that 404X0 personnel were a "low use" specialty. That is, members of this AFSC responded to less than 300 of the 1,366 knowledge items listed. A careful review of those knowledge items used, and a subsequent comparison between these data and the current training documents was performed (see Table 18). Findings indicate adequate coverage of EPI knowledges in initial skills training for 404X0 personnel.

This area is one of great concern and was one reason for this OSR being conducted. Further information may be desired by classification and training personnel at various levels. The AFPT number cited in the first paragraph of this discussion is provided so complete EPI data may be obtained by written request (including AFPT number) to: Chief, Airman Analysis Branch (OMYO), Randolph AFB, Texas 78150-5000.

IMPLICATIONS

A special topic of interest and one reason for this OSR being conducted is the area of Electronics Principles (EP), due to an influx of electronic equipment into the career specialty. A thorough review of EP knowledge items indicates the current 404XO training documents adequately cover EP in initial skills training.

A thorough review of the current STS and POI indicate a need for review and a comparison made with current OSR survey data so that technical objectives in these training documents can be fine-tuned.

Job satisfaction indicators for first-enlistment, second-enlistment, and career TAFMS groups are higher than the 1985 comparative sample, indicating 404XO personnel enjoy the work they perform and other career ladder conditions.

Career ladder progression is normal, with 3- and 5-skill level personnel performing mainly technical tasks. The transition from the 5-skill to the 7-skill level clearly shows an increase in supervisory responsibilities, though 7-skill level personnel, as is often found in mechanical AFSCs, still perform many technical tasks.
